

Legendary Audio Expertise With Advanced Processing

With a full 700 watts under the hood, the Marantz SR6003 competes among the best. Add it's full complement of processing power and you have one hard-to-beat combination of audio and video in a single chassis.

On it's simple exterior, only three controls – power/standby, input selection, and volume keep operation simple. A drop-down door hides secondary controls.

Sleek, Powerful, and Easy, the Marantz SR6003 is a complete solution for your client's home theater system. Installation is a snap! - Only \$999

Your client is assured the best audio performance with all of the high bit-rate audio formats such as Dolby TrueHD, DTS-HD in both High Resolution and Master Audio implementations, as well as DSD and legacy formats such as Dolby Digital. The SR6003 lets you get the most out of these sources for your client by including Audyssey's remarkable MultEQ system. After "listening" to test tones sent to all your client's speakers, it provides a virtually perfect acoustical environment for up to six individual seats. In addition, MultEQ detects speaker wiring errors resulting in "out of phase" performance losses, automatically configures bass management for ideal integration of subwoofers and full range speakers, and calculates proper delays and speaker levels to produce the best possible surround soundfield.

Three HDMI inputs, all version 1.3 capable, and two HDMI outputs allow you to connect your client's high definition TVs to the newest source components. The SR6003's wide-bandwidth HDMI circuitry is ready to bring your client advances like Deep Color and xvYCC Color Space for visual reality that exceeds your client's expectations.

The SR6003 provides inputs for either XM or Sirius adaptor so your client can enjoy their choice of satellite programming. Other conveniences include an easy to use backlit remote controller, the ability to lock out front panel controls so your installation settings can't be disturbed by accident, and a shorter chassis that fits easily in a rack or on a shelf. A variety of system integration options (RS-232 communications port, DC trigger output, and a flasher input) let you program your client's SR6003 in any system from a simple one-room theater to the most complex multi-zone entertainment system.

Marantz's proprietary M-DAX (Marantz Dynamic Audio eXpander) makes even compressed audio signals (MP3 files, AM/FM broadcasts, etc.) sound closer to CDs. Your client will appreciate MDAX most when they take advantage of the SR6003's front panel USB input.

A high-density fluorescent front panel display gives your client all the information they need to operate their SR6003. In addition, a color GUI appears on your client's video display device to help make operation simple and easy to understand.

The SR6003's circuits derive their operating current from a high capacity linear power supply built around an oversize EI-core transformer and custom storage capacitors. The seven channel in-line amplifier array keeps high voltages isolated from low-level circuitry for the best sound quality. Each channel produces up to 100 continuous watts assuring that no matter what speakers your client has chosen - it will perform.
